DRIVE SELECTION SYSTEM [SKYACTIV-G 1.3, SKYACTIV-G 1.5 (WITH 4-1 EXHAUST SYSTEM)]

id0170q0002200

Purpose of Adoption

- A drive selection system has been adopted which achieves driving performance corresponding to the driver's intentions.
- With the sport mode, the following 3 points are changed from the normal mode to minimize the delayed acceleration response when a fast-response situation is required.
  1. Lower gear selected
  2. Improved shifting speed between gears
  3. Engine torque increases corresponding to accelerator opening angle

Service Point

- Not applicable

Common Inquiry

- When switching to “SPORT” mode, the vehicle automatically shifts to a lower gear speed. This function enhances the response to the accelerator operation by assuring manageable drive force in advance.
- The “SPORT” mode controls the output characteristics, shift timing and also shift-speed changes, which enable a greater than normal powerful acceleration response to the accelerator operation. As a result, smooth driving when passing or merging onto highways is achieved.

Other
