SIDE IMPACT BAR

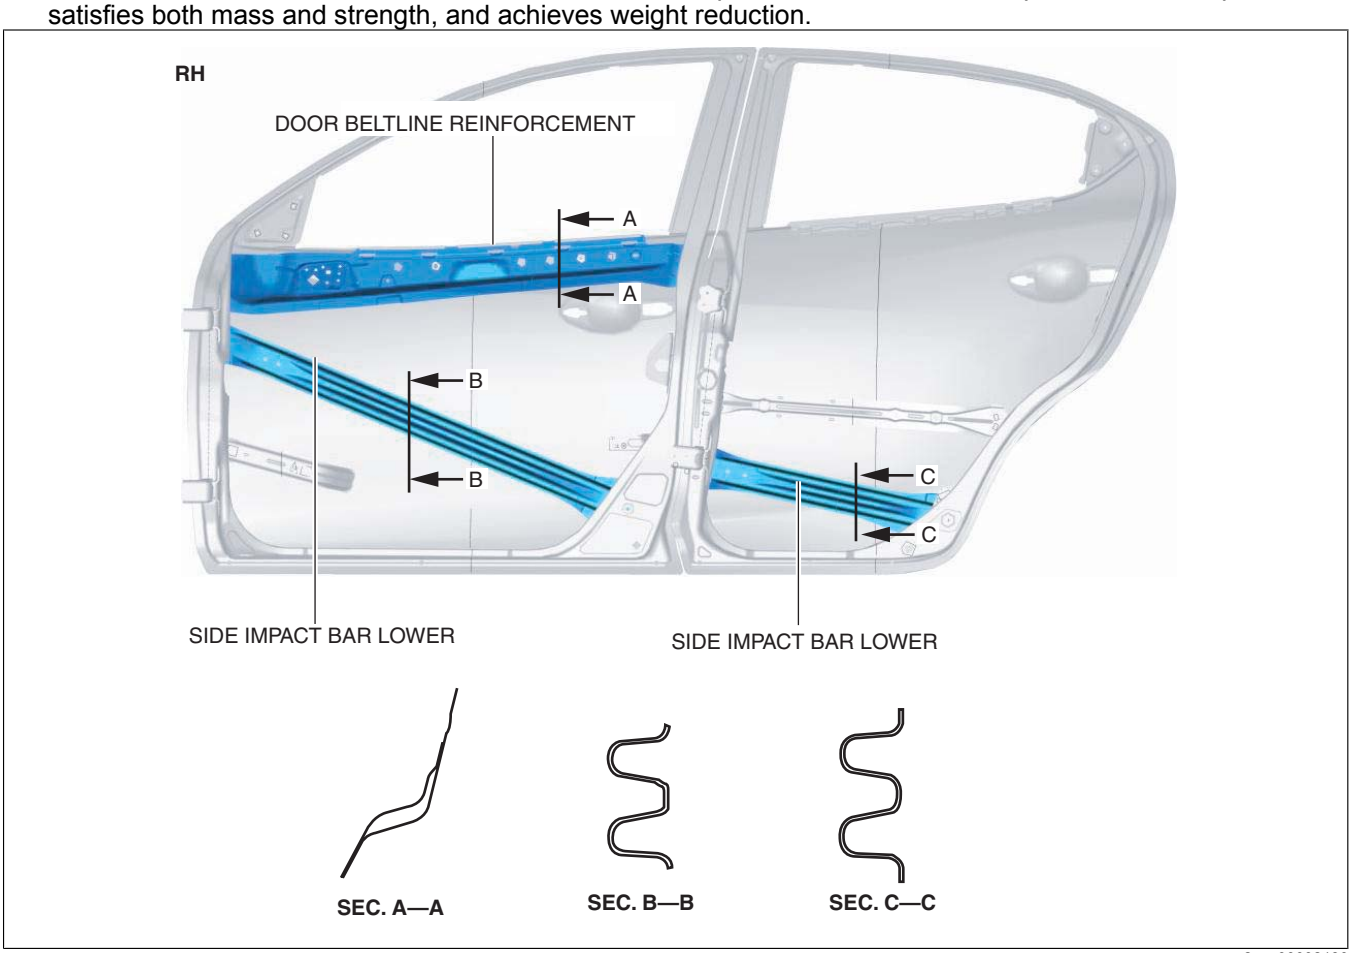

id091100414100

Purpose, Function

- A door beltline reinforcement and side impact bars have been adopted to prevent the doors from intruding into the cabin in a side collision.

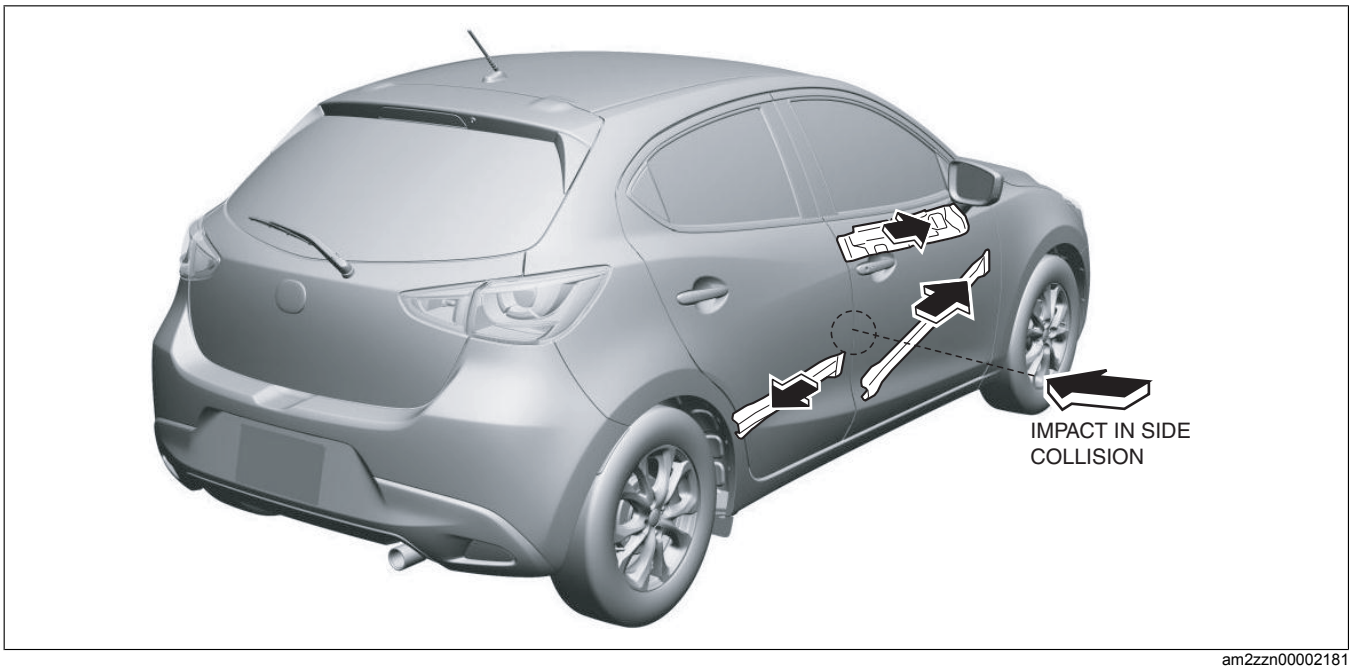

Construction

- Waveform (double-hat shape cross section) shape has been adopted to the following side impact bars:
  Front door
  — Side impact bar lower
  Rear door
  — Side impact bar lower
- By adopting the waveform (double-hat shape cross section) side impact bars, strength can be assured even with thinner steel plates, achieving both high rigidity and weight reduction.
- For the door beltline reinforcement of the front door, an optimal cross-sectional shape has been adopted which satisfies both mass and strength, and achieves weight reduction.

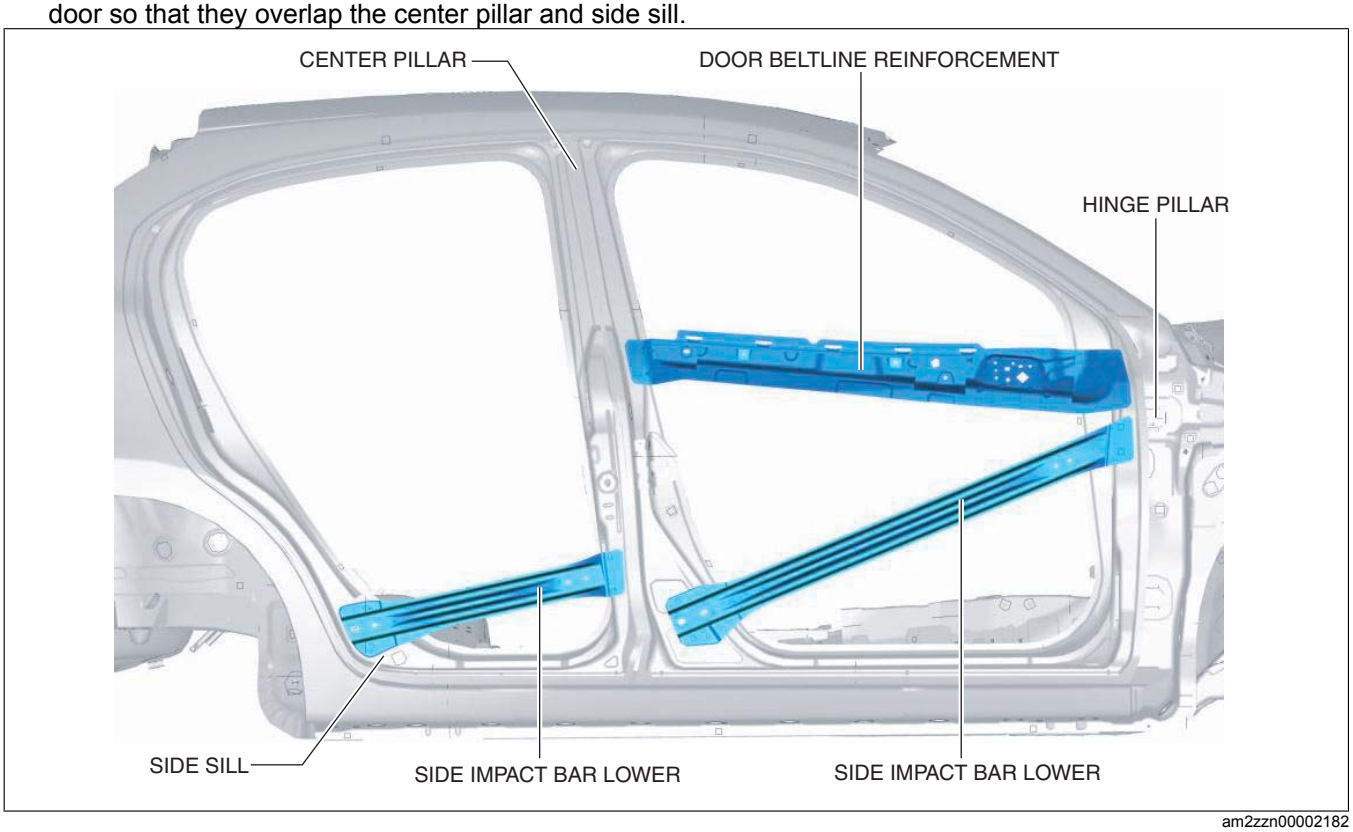

am2zzn00002180

- The door beltline reinforcement and side impact bars disperse the impact during a side collision.

am2zzn00002181

- Intrusion of a front door during a side collision is suppressed by positioning the door beltline reinforcement and lower side impact bars of the front door so that they overlap the hinge pillar and center pillar.
- Intrusion of a rear door during a side collision is suppressed by positioning the lower side impact bars of the rear door so that they overlap the center pillar and side sill.
